Dynamic Weather Routes Architecture Overview

Hassan Eslami (UCSC UARC)
Michelle Eshow (NASA)
2/18/14
CTAS (Center/TRACON Automation System) Software Platform Overview

- CTAS: A platform for real-time, trajectory-based automation and controller decision support tools

- Notable controller decision support tools based on CTAS
  - Traffic Management Advisor (TMA)
  - Direct-To (D2)
  - Terminal Sequencing and Spacing (TSS)
  - Dynamic Weather Routes (DWR)

- CTAS main internal functions:
  - External input data processing (Flight plans, Tracks, Weather, Wind)
  - 4-D trajectory generation
  - Decision automation algorithms
  - Advisories generation
  - Interactive decision support graphical user interface
General CTAS System in Live Data Context

Live track data from direct FAA-to-NASA feeds

CTAS

Host or ERAM Track, Flight Plan Messages

Airspace Adaptation Data

Aircraft Performance Data

Rapid Refresh Wind Forecast

Corridor Integrated Weather System Convective Forecast
Direct-To System in Live Data Context

Direct-To does not use weather data

Host or ERAM Track, Flight Plan Messages

Airspace Adaptation Data

Aircraft Performance Data

Rapid Refresh Wind Forecast

CTAS
DWR System in Live Data Context

ASDI Track, Flight Plan Messages

Host or ERAM Track, Flight Plan Messages

Airspace Adaptation Data

Aircraft Performance Data

CTAS

FACET (Future ATM Concept Development Tool)

Route Traffic Management Initiatives Data

Special Use Airspace

Rapid Refresh Wind Forecast

Convective Weather Avoidance Contours

Corridor Integrated Weather System Convective Forecast

2/18/14

Version 1
DWR Input Data Sources and Update Rates

- Host/ERAM data (Flight plan, Track, etc.): Direct NASA-FAA feeds - 12 sec
- NAS configuration Chart Change Update from FAA (adaptation): From FAA - 56 days
- Aircraft performance data: NASA - static
- Corridor Integrated Weather System (CIWS) Convective Forecasts: From FAA - 5 Min, 120 min forecast
- Convective Weather Avoidance Contours (CWAM): Data derived from CIWS by CTAS weather processing scripts - 5 min, 120 min prediction
- Wind information (Rapid Refresh – RR): From NOAA - 60 minutes update and prediction
- Special Use Airspace (SUA) data: From public web site - 15 min
- Aircraft Situation Display to Industry (ASDI) data: FAA - 1 min
- Traffic Flow Management Data to Industry (TFMDI) for route traffic management initiative information: FAA - 5 min
CTAS Software Components

- Input Source Manager (ISM)
- Communications Manager (CM)
- Planview Graphical User Interface (PGUI)
- Timeline Graphical User Interface (TGUI)
- Route Analyzer (RA)
- Trajectory Synthesizer (TS)
- Profile Sector En-route (PFSE)
- Dynamic Planner (DP)

AutoResolver (AAC)
DWR Software Components
DWR Software Components
ISM, CM, RA

• ISM (Input Source Manager)
  – Integrates and consolidates data from Center Host Computers (Host or ERAM)
  – Performs flight state filtering and state estimation (heading, vertical speed)

• CM (Communications Manager)
  – Internal data exchange hub for CTAS processes (PFSE, RA, PGUI)

• RA (Route Analyzer)
  – Generates all possible horizontal trajectories a flight may take, using TS (Trajectory Synthesizer)
  – Intended for arrival traffic; only one route generated for DWR case

Note: All processes read adaptation data at start-up
DWR Software Components
PFSE, PGUI

• PFSE (Profile Selector En-Route)
  – Multi-threaded algorithm engine
  – Uses multiple threads of **TS (Trajectory Synthesizer)** and **AAC (Advance Airspace Concept/Auto Resolver)** for trajectory and maneuver calculations
  – Generates among many data types, conflict and advisory information

• PGUI (Planview GUI)
  – Interactive decision support graphical user interface
  – Mimics the controller DSR

**Note:** All processes read adaptation data at start-up
DWR Software Components
TS, AAC

• TS (Trajectory Synthesizer)
  – Invoked by PFSE and RA
  – Uses aircraft’s position data (initial and destination), performance data, speed information, route list, and wind information to predict flight path profile (horizontal, vertical, speed, time, turns, etc.)

• AAC (Advance Airspace Concept/Weather and Traffic Auto Resolver)
  – Invoked by PFSE
  – Accepts as input data the trajectory, route, and conflict information
  – Proposes potential conflict free maneuvers
  – PFSE and AAC reiterate on intermediate maneuvers and conflict information towards a final conflict free maneuver

Version 1
Direct-To Software Components – Foundation for DWR

- Input Source Manager (ISM)
- Communications Manager (CM)
- Profile Sector En-route (PFSE)
- Direct-To Algorithm
- Trajectory Synthesizer (TS)
- AutoResolver (AAC)

Route Analyzer (RA)
Trajectory Synthesizer (TS)

Direct-To List

Version 1

2/18/14
DWR Changes to Direct-To Software

Performance improvements:
- Multiple TS thread
- Multiple thread of resolution cycle
DWR Internal Data Flow: RA

CM ➔ RA: Track, Flight Plan ➔ Route Type To PFSE
RA ➔ TS: TS Input Data ➔ Trajectory
TS ➔ Aircraft Model Database
TS ➔ Wind Data Storage
DWR Internal Data Flow: PFSE

- **CM**
  - Track, Flight Plan, Weather File Name
  - Parsed Route for CM sim Files
  - Data From RA
  - Data From PGUI
  - Data To PGUI

- **PFSE**
  - TX Input Data
  - Trajectory
  - From PFSE
  - Maneuver Data

- **AAC**
  - • Maneuver - Capture And Auxiliary Waypoints
  - • Manual Trial Planning Data
  - • Aircraft Information
  - • Traffic & Weather Conflict
  - • Trajectory Time Steps & Waypoints
  - • AAC Parameter File Location

- **WX. Data**
  - Parsed Route for CM sim Files

- **Aircraft Model Database**
  - Wind Data Storage

- **Direct-to Flight List**
- **DWR Resolutions, Trajectory, Traffic and Weather Conflicts, Time Savings**
- **Manual Trial Plan info: Auto Selection Capture Fix, Time Savings, Conflict, Trajectory**
- **Capture Waypoint List For All Aircraft**
- **Flight Plan Trajectory Status (Success, Failure)**
DWR Internal Data Flow: PGUI

- Sector Loading Information
- Trial Plan Request for Sector Analysis

CM

- Track, Flight Plan, Weather File Name
- Data To FACET
- Data From FACET
- Data To PFSE
- Data From PFSE

PGUI

- WX. Data

- Trial Plan Maneuver Request
- Trajectory Data Request
- Conflict Prediction Parameters (adjusted from PGUI)

- Direct-To Flight List
- DWR Resolution, Trajectory, Traffic and WX Conflicts, Time Savings
- Manual Trial Plan info: Auto Select Capture Fix, Time Savings, Conflict, Trajectory
- Capture Waypoint List For All Aircraft
- F.P. Trajectory Status (Success, Failure)

Version 1 2/18/14
DWR/CTAS Host Data Elements: Host Flight Plan

• Time received
• Aircraft Identification
  – Host Computer Aircraft ID
  – Call sign
  – Aircraft data/type (FAA designated type)
  – Beacon code

• Facility Information
  – Controlling Facility

Note: Flight plan information is required on initiation of a flight and whenever the value of an element changes
DWR/CTAS Host Data Elements: Host Flight Plan – Cont’d

• **Flight Information**
  – Filed true airspeed
  – Assigned altitude
  – Planned route
  – CenterParsed Route (AK Route)
  – Coordination fix
  – Coordination time
  – Temporary Altitude

• **Status**
  • \(P\) (proposed): Flight that will take off at some future time (Proposed or planned)
  • \(E\) (Estimated): Flight that is crossing center boundaries and will be picked up in the air at the coordination fix and coordination time.
  • \(D\) (Departed): Flight that is departing an airport. Will be tracked soon.
DWR/CTAS Host Data Elements: Host Track

• Data arrival time to CTAS
• Host track time
• Aircraft Identification
  – Host Computer Aircraft ID
  – Call Sign

• Track Source Information (ARTS, STARS, HOST, ERAM)
  – Source type (used by ISM to filter)
  – Facility ID
  – Sector ID
DWR/CTAS Host Data Elements: Host Track – Cont’d

- **Flight Information**
  - Altitude (feet above MSL)
  - Ground speed
  - Coasting indicator (Coast bit == ‘C’ if true)
  - Latitude
  - Longitude
DWR/CTAS Host Data Elements: Drop Track, Delete Aircraft, Time Sync

• **Drop Track:**
  – Aircraft Identification
    • Host Computer Aircraft ID
    • Call Sign
  – Controlling Facility

• **Delete Aircraft:**
  – Host Computer Aircraft ID
  – Call Sign

• **Host/Application Time Synchronization:**
  – Host time sync
  – Hours
  – Minutes
  – Seconds
CTAS Adaptation

- Each ARTCC adapted separately and updated on the 56-day FAA cycle
- Vast majority of adaptation from FAA sources, including NFDC, ACES, and ERAM data
- Definition of arrival procedures generated by hand (e.g., meter fixes, stream classes, etc.)
- About 12K lines of custom adaptation per site
  - Much can be modeled on existing sites
  - If arrivals not of interest, can be simplified
Software Characteristics

- Mixture of C, C++, Java, scripts
- Multi-threading used as necessary
- Message-passing is by TCP/IP message, defined by C data structures
- Each process maintains internal database of flights, via a binary tree
- Common code shared among processes, via libraries
CTAS Software Stats

• C/C++ stats:
  – 1M lines of code in 5K files
  – 800K lines of comments

• Java stats:
  – 165K lines of code in 800 files
  – 180K lines of comments

• Stats come from Understand product
CTAS Software Dependencies

- Linux or Mac OSX (NOT Windows)
  - Currently supporting RedHat 5.8, CentOS 6.4, OSX 10.7
  - 64-bit compilation using GNU GCC, Oracle Java compilers
- Various free libraries:
  - X11/Motif (graphics)
  - QT, QWT (graphics)
  - HDF5 (weather format)
  - XML (adaptation format)
  - Python
  - MySQL (optional)
CTAS Directory Structure

CTAS

software

realtime_procs

comm_mgr
dynamic_planner
etc.: 1 dir per processes

offline_procs

libraries

Various analysis tools

scripts

adaptation

ZFW

ZAB

etc.
